UNIVERSITY OF MANITOBA December 8, 2014 (6:00 pm - 9:00 pm)

FINAL EXAMINATION

Solution draft PAGE NUMBER 1 of 4

COURSE NO.: PHYS 1050 TIME: 3 hours

EXAMINERS: C.-M. Hu, F. Lin, J. Sirker EXAMINATION: Physics 1: Mechanics

All questions are of equal value. Answer all 25 questions. No marks are subtracted for wrong answers,

Record all answers on the bubble sheet provided. USE PENCIL ONLY! Black pen will look good but may not be read reliably by the scoring machine. Mark only one answer for each question! Select the answer that is closest to yours.

A formula sheet is provided for your use; you may not use your own formula sheet or any other materials or notes. Calculators of any type are allowed, but not devices that store text or that can communicate with other such devices.

Be sure your name and student number are printed on the score sheet and the student number correctly coded in the box at the top right-hand side of the sheet. DO NOT start your student number with 00.

1. Over a short interval, starting at time t = 0, the coordinate of an automobile in meters is given by  $x(t) = 12t - 2t^3$ , where t is in seconds. The magnitudes of the initial (at t = 0) velocity and acceleration of the auto respectively are: V= dx = 12-6t2

a = dv = -12t

2, The coordinate of an object is given as a function of time by  $x = 4t - 3t^4$ , where x is in meters and t is in seconds. Its average acceleration over the interval from t = 0 to t = 2 s is:

a) 
$$-8 \text{ m/s}^2$$

e) 
$$-18 \text{ m/s}^2$$

$$A = \frac{\Delta V}{\Delta t} = \frac{V(2) - V(0)}{2 - 0}$$

$$= \frac{-92 = -48 \text{ m/s}}{2}$$

3. At a stop light, a truck traveling at 30 m/s passes a car as the car starts from rest. The truck travels at constant velocity and the car accelerates at 3 m/s2. How much time does the car take  $x = 30t = \frac{1}{2}0t^{2} = \frac{3}{2}t^{2}$ to catch up to the truck?

e) 25 s 
$$\Rightarrow \frac{1}{2} t(3t-60) = 0$$

At time t = 0 a car has a velocity of 16 m/s. It slows down with an acceleration given by a = -0.50t, in m/s<sup>2</sup> for t in seconds. At the end of 2.0 s it has traveled:

axB = absine

12 = 0 | 6 = 6

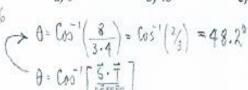

2ablung = ab

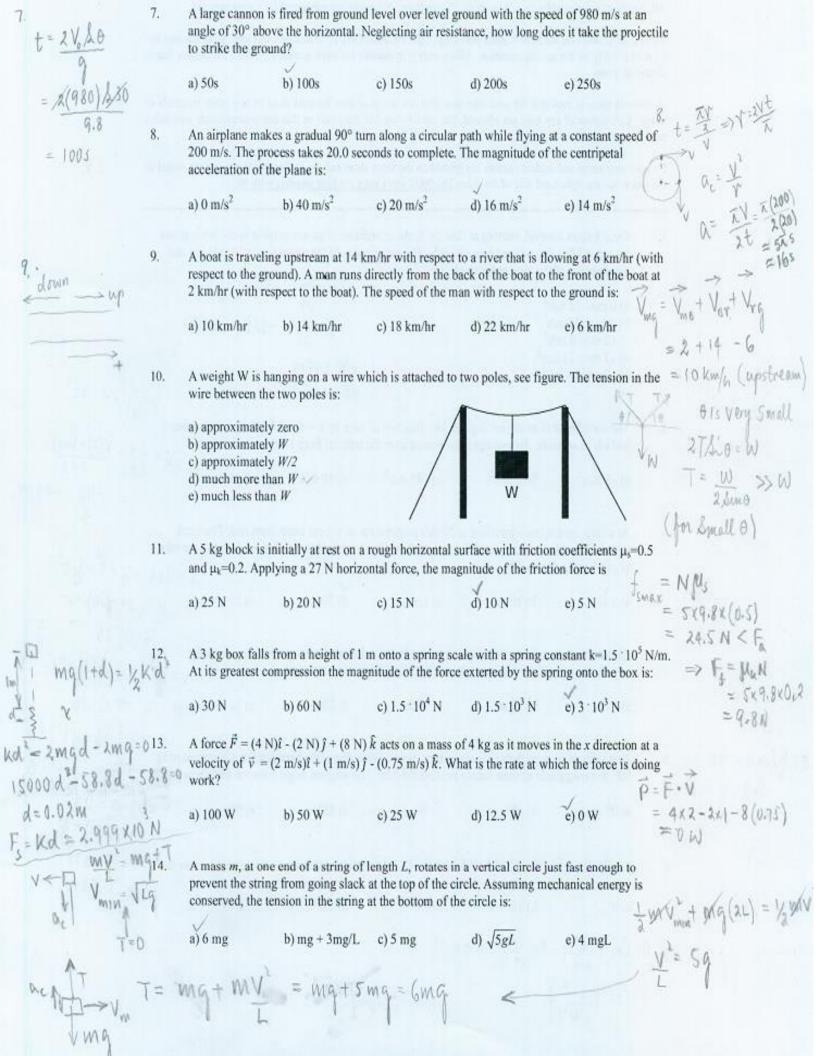

See 1/4 => 0:30

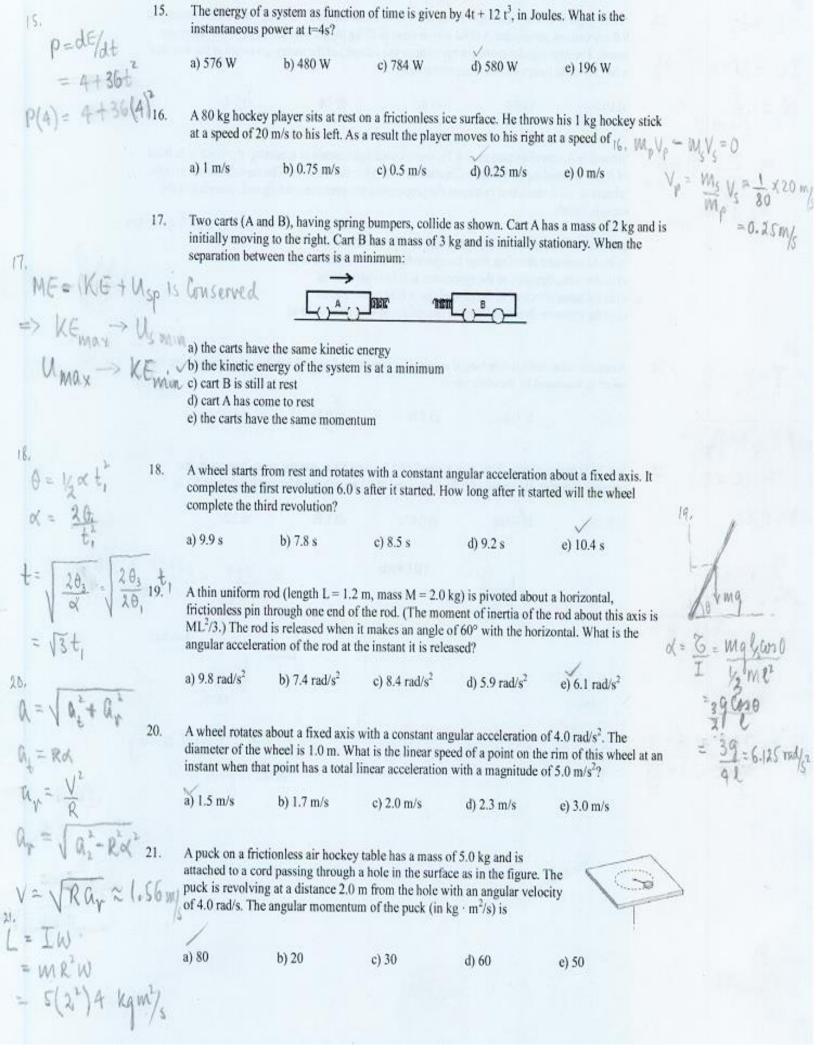

$$4. V = \int -3t dt = -3t^{1} + C$$
e) 31 m  $V(0) = 16 \rightarrow C = 16$ 

x= ((16-4t2)dt Two vectors lie with their tails at the same point. When the angle between them is increased to 90°, the magnitude of their vector product doubles. The original angle between them was about:  $= 16 \pm \frac{1}{12} \pm \frac{1}{1$ 

Let  $\vec{S} = (1 \text{ m})\hat{i} + (2 \text{ m})\hat{j} + (2 \text{ m})\hat{k}$  and  $\vec{T} = (4 \text{ m})\hat{k}$ . The angle between these two vectors is:

TIME: 3 hours

EXAMINATION: Physics 1: Mechanics

EXAMINERS: C.-M. Hu, F. Lin, J. Sirker

22. IW = (I+mR2) Wg

A merry-go-round of radius R = 2.0 m has a moment of inertia  $I = 250 \text{ kg} \cdot \text{m}^2$ , and is rotating at 9.0 revolutions per minute. A child whose mass is 25 kg jumps onto the edge of the merry-goround. The new angular speed (in revolutions per minute) of the merry-go-round at the moment when the child jumps onto it is approximately

- Mi= I+me, m:
- a) 10.0
- b) 9.0
- c) 8.5
- d) 7.1

= 6,43 rev/m/n

Spaceship A, traveling past us at 0.7c, sends a message capsule to spaceship B, which is in front of A and is traveling in the same direction as A at 0.8c relative to us. The capsule travels at 0.9c relative to us. A clock that measures the proper time between the sending and receiving of the capsule travels:

23. Concept question

- a) in the same direction as the spaceships at 0.7c relative to us
  - b) in the opposite direction from the spaceships at 0.7c relative to us
  - c) in the same direction as the spaceships at 0.8c relative to us
- d) in the same direction as the spaceships at 0.9c relative to us
  - e) in the opposite direction from the spaceships at 0.9c relative to us

A certain automobile is 6 m long if at rest. If it is measured to be 3.6 m long by an observer, its 24. speed as measured by the observer is:

- a) 0.1c b) 0.3c
- c) 0.6c
- d) 0.8c
- e) 1.0c

Star S1 is moving away from us at a speed of 0.8c. Star S2 is moving away from us in the opposite direction at a speed of 0.2c. The speed of S1 as measured by an observer on S2 is:

V= 0.80

- a) 0.71c
- № 0.86c
- c) 0.93c
- d) 1.0c
- e) 1.2c

25

0.80

$$N_{s} = \frac{1 - \overline{n} \lambda}{N_{s} + \Lambda} = \frac{1 - (0.5)(0.8)}{0.5 \cdot (-0.8)} = 0.86 C$$

THE END

5, at rest but earth moving With respect to 51.
